

The Pen Tool

The PEN TOOL allows you to create custom vector paths that can be filled, outlined or selected. It is one of Photoshop's more difficult tools to master, but if you intend to use Photoshop to create detailed artwork, it is worth learning how to use it

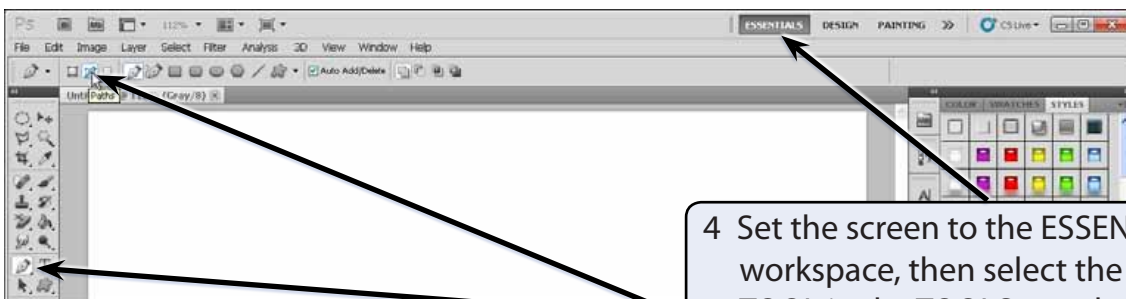

Starting a New Document

- 1 Load Photoshop or close the current files and select NEW from the FILE menu.

2 Set the WIDTH to 800 pixels, the HEIGHT to 600 pixels and the BACKGROUND CONTENTS to WHITE.

- 3 Select OK to start the document,

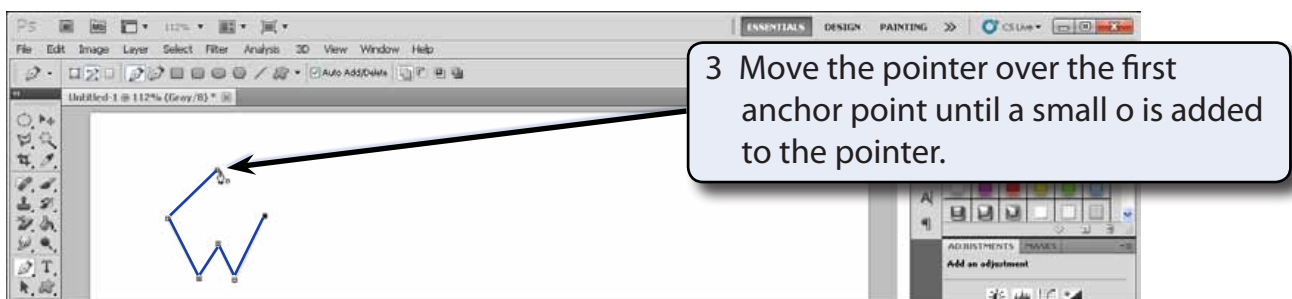

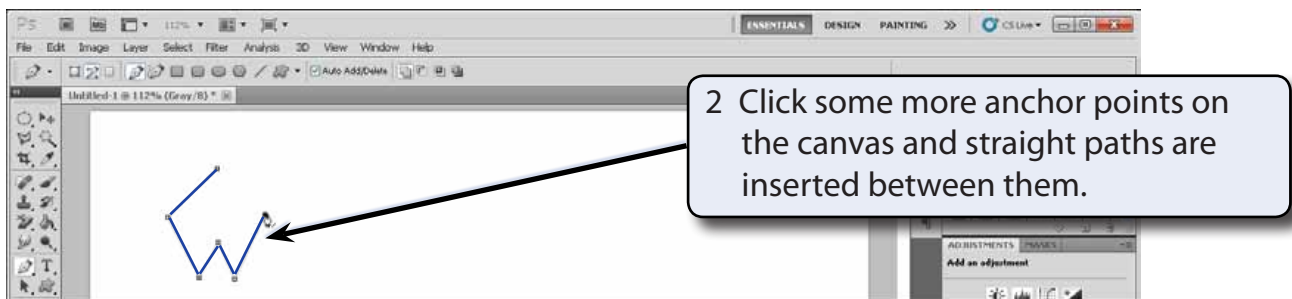

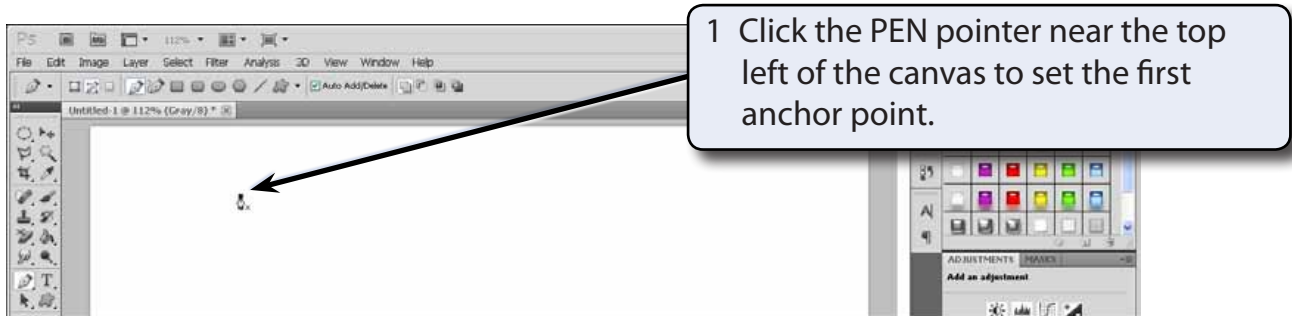

4 Set the screen to the ESSENTIALS workspace, then select the PEN TOOL in the TOOLS panel and check that the PATHS icon is selected in the OPTIONS BAR.

NOTE: If you want the paths created using the PEN TOOL to be filled as they are drawn, the SHAPES icon can be selected in the OPTIONS BAR.

Drawing Straight Paths

Straight lines or paths are easily created with the PEN TOOL. Points are clicked on the canvas and straight paths are inserted between those points. The points are called ANCHOR POINTS.

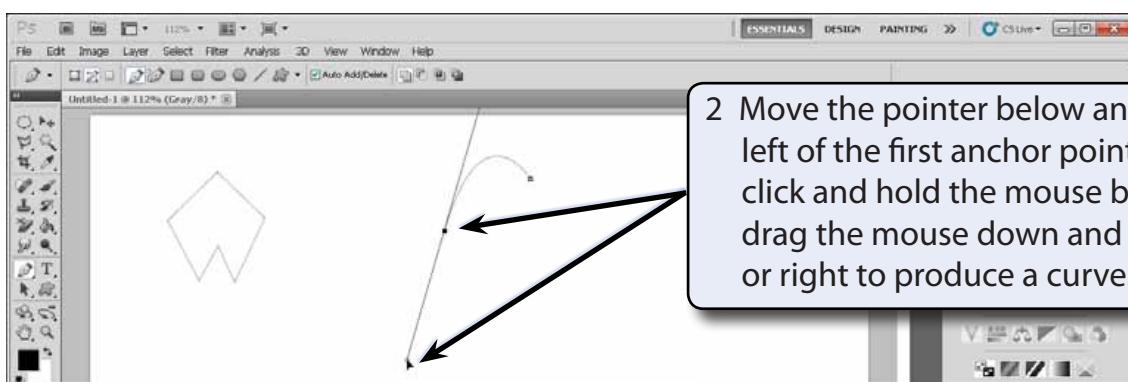

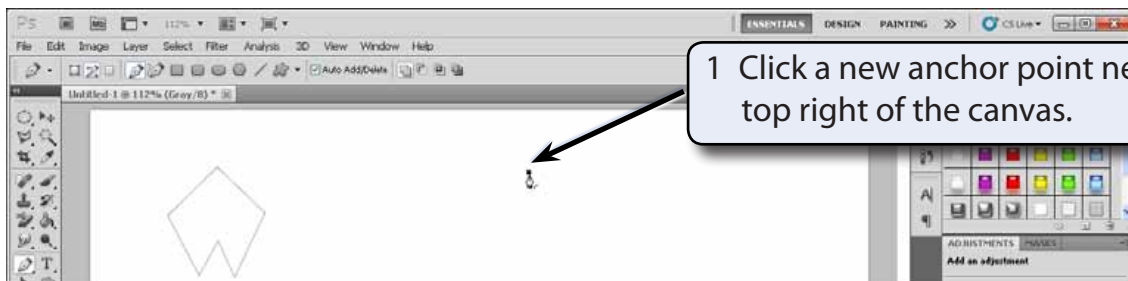

NOTE: The small o is added to the PEN pointer when it is exactly over the first anchor point.

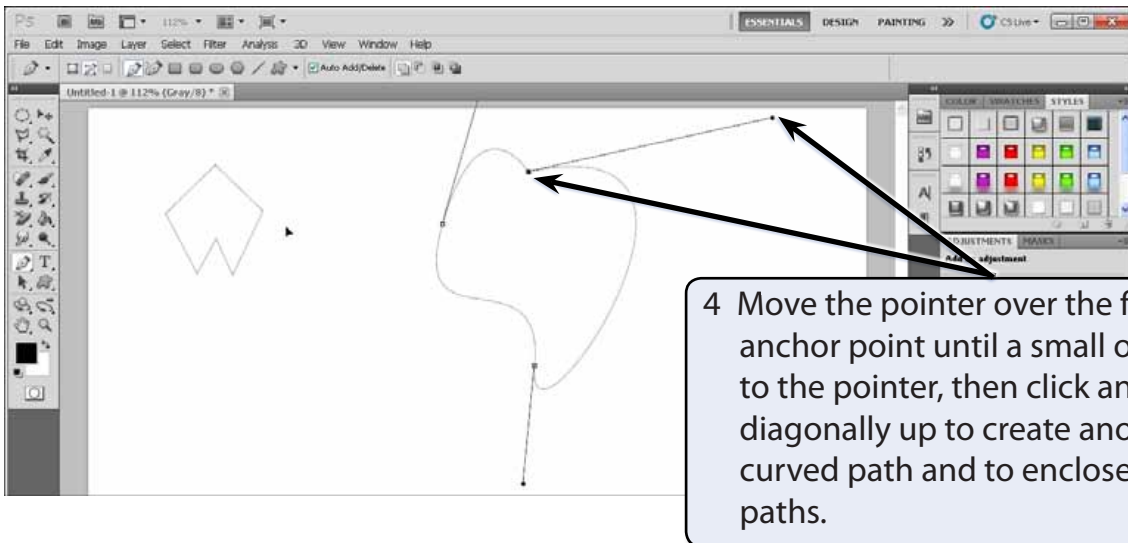

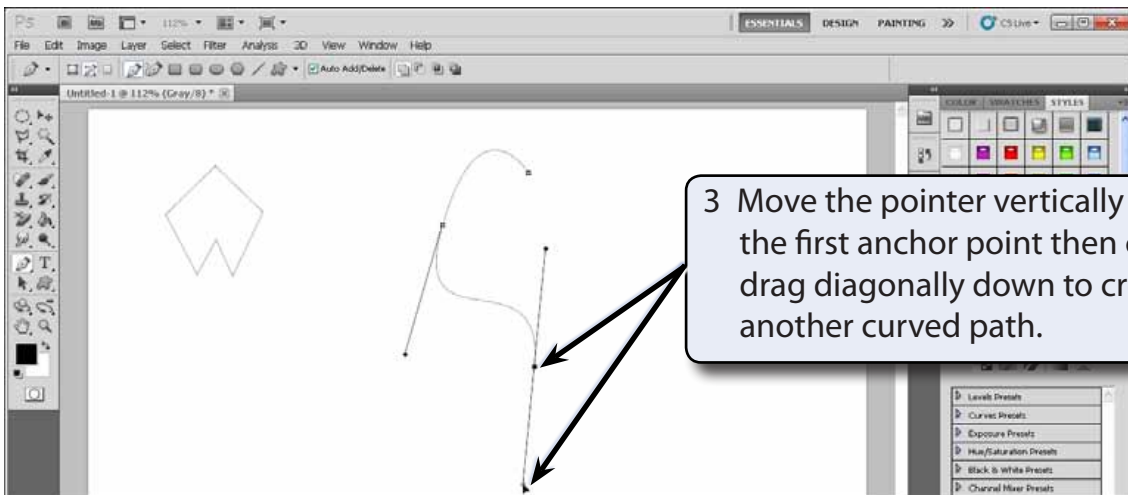

NOTE: If you don't want an enclosed shape, just some open paths, select the **DIRECT SELECTION TOOL** in the **TOOLS** panel when you have drawn the paths and click outside the paths to set them.

Creating Curved Paths

Curved paths are created by clicking and dragging an anchor point. When you do this lines with handles, called Bezier Lines, are added to the anchor point. These Bezier Lines allow you to adjust the curve.

NOTE: You can drag either of the Bezier handles to adjust the curve if you are not happy with it.
